Acta Crystallographica Section E: Structure Reports Online is the IUCr's highly popular open-access structural journal. It provides a simple and easily accessible publication mechanism for the growing number of inorganic, metal-organic and organic crystal structure determinations. The electronic submission, validation, refereeing and publication facilities of the journal ensure very rapid and high-quality publication, whilst key indicators and validation reports provide measures of structural reliability. The journal publishes over 4000 structures per year. The average publication time is less than one month.

Tetraquatetrakis(4,4'-bipyridine dioxido- κ O)terbium(III) octacyanido-molybdate(V)

Su-Yan Qian and Ai-Hua Yuan*

School of Biological and Chemical Engineering, Jiangsu University of Science and Technology, Zhenjiang 212003, People's Republic of China

Correspondence e-mail: aihuayuan@163.com

Received 30 March 2011; accepted 26 May 2011

Key indicators: single-crystal X-ray study; $T = 291$ K; mean $\sigma(\text{C}-\text{C}) = 0.002$ Å; R factor = 0.016; wR factor = 0.043; data-to-parameter ratio = 16.5.

In the title compound, $[\text{Tb}(\text{C}_{10}\text{H}_8\text{N}_2\text{O}_2)_4(\text{H}_2\text{O})_4][\text{Mo}(\text{CN})_8]$, both metal atoms are eight-coordinated. The Tb^{III} atom displays a dodecahedral geometry, while the Mo^{V} ion exhibits a distorted square-antiprismatic geometry. The Tb atoms are located on a special position of site symmetry $\bar{4}$, whereas the Mo atoms are located on a twofold rotation axis. The cations are linked by $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds.

Tetraaquatetrakis(4,4'-bipyridine dioxide- κO)terbium(III) octacyanomolybdate(V)

S.-Y. Qian and A.-H. Yuan

Comment

In the past few years, octacyanomometallate-based complexes have attracted considerable attention in the field of cyanide-bridged hetero-metallic system. Many assemblies based on $[M^V(CN)_8]^{3-}$ ($M = Mo$ or W) and lanthanide ions can take a variety of structures (Chelebaeva *et al.*, 2009; Kozieł *et al.*, 2010; Ma *et al.*, 2009; Przychodzeń *et al.*, 2007; Qian *et al.*, 2010; Wang *et al.*, 2006; Zhou *et al.*, 2010). Recently, we have used $[Mo(CN)_8]^{3-}$ as a building block to react with Tb^{3+} and 4,4'-bipyridine dioxide (4,4'-dpdo) obtaining a new ionic complex, $[Tb(4,4'-bpdo)_4(H_2O)_4][Mo(CN)_8]$.

In the structure, the eight-coordinated Tb^{III} center displays a decahedron geometry, while each $[Mo^V(CN)_8]$ moiety exhibits a distorted square antiprismatic geometry. The average values of $Mo-C$ and $C-N$ bond distances are 2.171 and 1.155 Å, respectively, while the $Mo-C-N$ units are nearly linear. The anions are linked by O-H...O hydrogen bonds.

Experimental

Single crystals of the title compound were prepared at room temperature in the dark by slow diffusion of a H_2O solution (3 ml) containing $Tb(NO_3)_3 \cdot 6H_2O$ (0.05 mmol) and 4,4'-dpdo (0.05 mmol) into a CH_3CN solution (15 ml) of $[HN(n-C_4H_9)_3]_3[Mo(CN)_8] \cdot 4H_2O$ (0.05 mmol) (Bok *et al.*, 1975). After two weeks, yellow block crystals were obtained.

Refinement

The H atoms of 4,4'-bipyridine dioxide ligands were ideally positioned with $C-H = 0.93$ Å and included in the refinement using a riding model with $U(H)$ set to $1.2 U_{eq}(C)$. The H atoms bound to oxygen atoms were located from difference maps and refined as riding with $U(H)$ set to $1.2 U_{eq}(O)$.

Figures

Fig. 1. ORTEP diagram of the title compound. Hydrogen atoms have been omitted for clarity and thermal ellipsoids are presented at the 30% probability level.

Fig. 2. Perspective view of the title compound in *ab* plane. Hydrogen atoms and coordinated water molecules have been omitted for clarity.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
